New cell factor derivative causing cells to die, for anticancer therapy. Disclosure; Page 2; 10pp; Chinese. The present invention relates to a cell factor derivative (TRAILD) used as an anticancer derivative. The TRAIL protein can be expressed in soluble form in bacterial cytoplasm. The present sequence represents a TRAILD amino acid sequence. Recombinant TRAILD fusion proteins can be used in anti-cancer medicaments to treat cancer of the liver, breast, or kidney. It can also be used to treat leukaemia

The present invention relates to the isolation of cDNA encoding human tumour related apoptosis inducing ligand (Trail), and the Trail protein. The Trail full length cDNA is cloned, and is utilised to oreate a Trail prokaryotic expression system. The full length Trail cDNA is used to respectively clone cDNA of soluble ectocytic segment Trailing and Trail 114, and respectively create Trailing cDNA and Trailing and Trailing increase the expression and quantity of the Trail, Trailing, and arailing proteins, and may be useful in a new preparation for killing tumour calls. The present sequence represents the partial human Trail protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for producing Tumour Necrosis Factor (TNF) Related Apoptosis Inducing Ligand (TRAIL) protein, and for crystallising the TRAIL protein and its three-dimensional structure, where the TRAIL protein has improved activity, which specifically kills cancer cells and cells infected by virus. The present sequence is human TRAIL, which was used in the invention

This invention relates to an expression vector containing the tumour necrosis factor related apoptosis inducing ligand (TRAID) protein receptor SDR5. The invention also comprises a method for producing the SDR5 protein from an E. coli transformed with the vector. The method of the invention is useful for crystalising the TRAIL-SDR5 complex. A TRAIL COMPLEX is useful for developing recombinant proteins i.e. proteins with improved stability or cytotoxic activity of a TRAIL protein which involves changing the amino acids of the AA loop to increase the warious interactions between amino acids or from the binding site of metal ions or the disulfide bonding, or changing the corresponding amino acids of the homotrimer interface or homodimer interface to increase the various interactions between amino acids or from the binding site of conferring specificity for the recognition between TNF family members and structure of the TRAIL-SDR5 complex is useful for the molecular strategy conferring specificity for the recognition between TNF family members and TNF receptor family members and for the development of TRAIL protein, which has a better stable, cycotoxic activity or an improved receptor homogeneous is factor receptor apoptosis including ligand (TRAIL) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel expression vector containing an sDR5 encoding gene transformed into Escherichia coli to produce sDR5 protein for crystallizing a tumor necrosis factor-related apoptosis-inducing ligand-sDR5 complex.
                                                                                                                                                                                        TRAIL; TNF receptor apoptosis including ligand; human; SDR5; tumour necrosis factor; crystal structure; TRAIL-SDR5 complex; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cha
                                                                                                                                                     Human TNF related apoptosis including ligand (TRAIL) protein.

The present invention relates to the isolation of cDNA encoding human the Trail full length cDNA is cloned, and (Trail), and the Trail protein. The Trail full length cDNA is cloned, and is utilised to create a Trail prokaryotic expression system. The full length Trail cDNA is used to respectively clone cDNA of soluble ectocytic segment Traill109 and Trail 114, and respectively create Traill109 cDNA and Traill109 and Traill expression systems. The prokaryotic expression systems created greatly increase the expression and quantity of the Trail, Traill09, and Traill14 proteins, and may be useful in a new preparation for killing tumour cells. The present sequence represents the partial human Trail protein, traill14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   76 VRERGPQRVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGE 135

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       138 IHEKGEYYIYSQTYFRFQEEIKENTKNDKQMVQYIYKYTSYPDPILLMKSARNSCWSKDA 197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB08265-83 represent tumour necrosis factor (TNF) ligands. The specification describes an AGP-3 polypeptide, which is TNF ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, e.g. rheumatorid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      78 ERGPQRVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELV 137

The invention relates to a TNF-related apoptosis-inducing ligand encoding (TRAIL) cDNA and its encoded polypeptide. The gene of the invention is related to mutational human tumour necrosin. The polypeptide of the invention is useful for inducing the death of tumour cells. The current sequence represents the TRAIL amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour necrosis factor and ApoL-related Leucocyte expressed Ligand 1; therapy; autoimmune disorder; rheumatoid arthritis; multiple sclerosis; systemic lupus erythematusus; SLE; insulin dependent diabetes mellitus; thrombocytopenia purpura; acute rheumatic fever; Goodpasture's syndrome; haemolytic anaemia; Grave's disease; myasthenia gravis; TRAIL protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Death induced ligand (TRAIL) cDNA and encoded polypeptide, useful for inducing the death of tumor cells, is related to mutational human tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   75 LVRERGPORVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNG

The present invention relates to Tumour necrosis factor (TNF) and Apolrelated Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules,
proteins (including homologues), and their antibodies. The invention in
particular relates to methods for regulating the interaction between TALL
land TALL-1 receptors (BCMA referred as B cell maturation factor) to
regulate monocyte, macrophage and B lymphocyte mediated immune responses.
TALL-1 protein is useful for identifying compounds that regulate B
C TALL-1 protein is useful for identifying compounds that regulate B
C TALL-1 protein is useful for identifying compounds that regulate B
C secont and all and a systemic lupus
erythematosus (SLE), insulin dependent diabetes mellitus, multiple
crythematosus (SLE), insulin dependent diabetes mellitus, multiple
cerythematosus (SLE), insulin dependent diabetes mellitus, multiple
collection and gravis, Grave's disease, autoimmune haemolytic
canaemia, autoimmune thrombocytopenia purpura, Goodpasture's syndrome,
c pemphigus vulgaris, acute rheumatic fever, post-streptococcal
corresponding nucleic acid sequence are also useful in diagnostic assays.
CC corresponding nucleic acid sequence are also thuman TRALL protein which
has 20-25% sequence identity with the C-terminal region of human TALL-1
corresponding nucleic protein TRALL protein is a TNF family member

The invention relates to a composition (I) comprising a protein complex in crystalline form, where the complex comprises an amino acid sequence of a Receptor Activator of Necrosis Factor RB (RANK) Ligand (RANKL) ectodomain. (I) is useful for identifying a compound with RANK modulating activity, and for identifying a RANK or OPG modulating compound. (I) is useful to intelligently design mutants that have altered biological properties and for identifying mutants that have altered biological properties and for identifying new therapeutic agents. (I) is also useful to computationally screen small molecule databases for chemical entities or compounds that can bind in whole, or in part, to RANK or RANKL. The present sequence represents a tumour necrosis factor (TNF) family member, TRALL (1d4v), used in a structural-based alignment study

The invention relates to a composition comprising a protein complex in crystalline form, where the complex comprises an amino acid sequence of a crystalline form, where the complex comprises an amino acid sequence of a creceptor activator of nuclear factor kappaB (NEKappaB) (RANKI) ligand (RANKI) ectodomain. The three-dimensional structural representation of a RANKI ectodomain crystal compound, and for identifying a RANK or costeoproteegerin (OPG) modulating compound, and for identifying a compound with RANK modulating activity. The crystals permit the determination of the three-dimensional X-ray diffraction structure of the crystal-line polypeptide to high resolution. The atomic structure coordinates are useful for identifying bone-forming compounds by methods which utilise the coordinates for solving the three-dimensional X-ray diffraction of the coordinates of other proteins, including mutant forms, to high resolution. The structural information may also be used in a variety of molecular modeling and computer-based screening applications to, for example design mutants of the crystallized RANKL, its receptors, or a portion or fragment of RANKL or its receptors. The coordinates of RANKL crystal, or subsets of such structural coordinates of the RANKL crystal, are useful for designing or identifying candidate compounds capable of modulating RANK biological activity, and for identifying compounds which

The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

Apoptosis is induced by certain cytckines which include TNF and TRAIL (also referred to as Apo-2 ligand, Apo-21). TRAIL is a type II membrane protein which induces apoptosis and nuclear factor-B (NF-B) activation in containing receptors. DR4 and DR5, as well as two deach domain. CC and DCR2, lacking the intracellular signalling death domain. TRAIL, and DCR2, lacking the intracellular signalling death domain. TRAIL, and DCR2, lacking the intracellular signalling death domain. TRAIL, comman cells are relatively resistant without showing significant toxic side effects. Thus, TRAIL has the potential to be a very useful cormal cells are relatively resistant without showing significant toxic side effects. Thus, TRAIL has the potential to be a very useful continuour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/timing and activity.

CC side effects. Thus, TRAIL products solls mechanisms for the induction of apoptosis of tumours cells. The splice variant polypeptides and polynucleotides can be used in gene therapy, to raise antibodies, to detect the levels, distribution and ratios of expression of TRAIL, and witch bind the variant TRAIL products and modulate its activity (agonists and antagonists). Pharmaceutical compositions, comprising an expression cytotoxic effect in cancer cells and for treatment of diseases which can cytotoxic effect in cancer cells and for treatment of diseases which can be ameliorated, cured or prevented by lowering or raising the level of the amino acid sequences are useful for causing the level of the amino acid sequences are useful for causing the lawing and expression of diseases that may be treated include cancer, neurodegenerative diseases a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diseases, autoimmune diseases, diseases involved in the non-normal development of tissues and aging. TRAIL's gene is located on chromosome 3Q26. The sequence presented is the human TNF-related apoptosis inducing ligand (TRAIL) splice variant 8, rp1-6-6, protein which has had an C-terminal section of the conserved TNF domain deleted

```
The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumour necrosis factor (TNF) related apoptobis inducing ligand (TRAAIL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

Apoptosis is induced by certain cytokines which include TNF and TRAIL (also referred to as Apo-2 ligand, Apo-2L). TRAIL is a type IT membrane protein which induces apoptosis and nuclear factor-B (NF-B) activation in many tissues and cells. Receptors for TRAIL include two death domain containing receptors, DR4 and DR5, as well as two decoy receptors, DCR1 and DCR2, lacking the intracellular signalling death domain. TRAIL, induced by type I interferons, induces apoptosis in tumour cells, whereas normal cells are relatively resistant without showing significant toxic side effects. Thus, TRAIL has the potential to be a very useful antitumour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/timing and activity. Containing these factors could provide possible mechanisms for the induction of apoptosis of tumours cells. The splice variant polypeptides and polymucleotides can be used in gene therapy, to raise antibodies, to contain the variants, in a biological sample and to identify compounds which bind the variant TRAIL products and modulate its activity (agonists and antagonists). Pharmaceutical compositions, comprising an expression vector or any of the amino acid sequences, are useful for causing a cytotoxic effect in cancer cells and for treatment of diseases which can be used in diseases that may be treated include cancer, neurodegenerative the amino acid sequences, are useful for causing a diseases that may be treated include cancer, neurodegenerative cutility in blocking or decreasing the activity of the minor of diseases intended and each of the ameliorment of diseases intended and each of the ameliorment of the amelior and aniver many of the amelior and aniver man
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New splice variants of tumor necrosis factor-related apoptosis inducing ligand (TRAIL) isolated from B-lymphocytes and liver, useful to treat diseases or disorders associated with low expression of the variants.

The polypeptides can be used in treatment of neurodegenerative disease, lupus erythematosus, rhuematoid arthritis, and SEP. The polypeptides are apoptotic in central nervous system cells, antigenic and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease and a therapeutic target, e.g. its apoptotic activity can be blocked with an anti-TRAIL antibody or a TRAIL equivalent that binds to specific receptors, inhibiting formation of natural complex. The present sequence represents a polypeptide of the invention

AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, e.g. rheumatoid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were by prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences draw the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

tumor necrosis factor alpha precursor - sheep
U;Alternate names: cachectin; TWF alpha
C;Species: Ovis orientalis aries, Ovis ammon aries (domestic sheep)
C;Date: 10-Sep-1999 #sequence revision 10-Sep-1999 #text_change 04-Feb-2000
C;Accession: UH0529; S48118; S13114; S20661
R;Green, I.R.; Sargan, D.R.
A;Title: Sequence of the cDNA encoding ovine tumor necrosis factor-alpha: problems with A;Reference number: JH0529; MUID:92112044; PMID:1765267
                                                                                                                                                                                                 R;Sanjanwala, M.; Edwards, A.
submitted to the EMBL Data Library, September 1991
A;Description: Baboon Tumor Necrosis Factor Derived from Sequences of Genomic DNA.
A;Reference number: S22052
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R.Nafb, A.D.; Barcham, G.J.; Brandon, M.R.; Andrews, A.E.

FASEB J. 13:181-189(1999). -!- FUNCTION: Inhibits vascular endothelial growth and angiogenesis

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation — the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). -!- FUNCTION:

(in vitro).

-!- SUBGNATT: Homotrimer (Potential).

-!- SUBGNATT: Homotrimer (Potential).

-!- SUBGNATT: Homotrimer Specifically expressed in endothelial cells.

-!- TISSUE SPECIFICITY: Specifically expressed in endothelial cells.

-!- TISSUE SPECIFICITY: Specifically expressed in endothelial cells.

Detected in placenta, lung, tkiney, skeletal muscle, pancreas, spleen, prostate, small intestine and colon.

-!- SIMILARITY: Belongs to the tumor necrosis factor family.

-!- SIMILARITY: Belongs to the tumor necrosis factor family.

C FUNCTION: Cyclokine that binds to TNFRSF3/LTBR. Binding to the

decoy receptor TNFRSF6 modulates its effects. Activates NFKB,

c the adenocarcinoma HT-29. Acts as a receptor for Herpes simplex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Name=2; Synonyms=LIGHT delta-TM;
IsoId=043557-2; Sequence=VSP 006452;
TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE SPLEEN BUT ALSO
FOUND IN THE BRAIN, WEAKLY EXPRESSED IN PERIPHERAL LYMPHOID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LUNG, APPENDIX, AND KIDNEY,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -i- PTM: N-glycosylated.
-i- PTM: The soluble form of isoform 1 derives from the membrane form by proteolytic processing.
-i- SIMILARITY: Belongs to the timor necrosis factor family.
-i- CAUTION: Ref.4 sequence differs from that shown due to a frameshift in position 178.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TISSUES AND IN HEART, PLACENTA, LIVER, LUNG, APPENDIX, AND KIL AND NO EXPRESSION SEEN IN FETAL TISSUES, ENDOCRINE GLANDS, OR NONHEMALOPOLETIC THROR LINES.
INDUCTION: UPREGULATED AFTER T-CELL ACTIVATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- SUBCELLULAR LOCATION: Type II membrane protein and secreted (isoform 1); Cytoplasmic (isoform 2).

                                             TISSUE-Lymphoma;

Force W.R., Todd P.K., Mikayama T.;

Force W.R., Todd P.K., Mikayama T.;

"Mouse LIGHT; molecular genetics, ligand binding and expression.";

Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Cytokine that binds to INFRSF3/LTBR. Binding to the decoy receptor TNFRSF6B modulates its effects. Activates NFKB and stimulates the proliferation of T cells.

-! SUBUNIT: Homotrimer (By similarity).

-! SUBCELDILAR DOCATION: Type II membrane protein and secreted (By

Stockine that binds to TNFRSFIA/TNFRI and TNFRSFIB/TNFRE. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of acchesia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBCELLUAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

FTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DISEASE: Cachexia accompanies a variety of diseases, including cancer and infection, and is characterized by general ill health

FUNCTION: Cytokine that in its homotrimeric form binds to TNFRSFIA/TNFR, TNFRSFIB/TNFBR and TNFRSFI4/HVEM. In its heterotrimeric form with LTB binds to TNFRSF3/LTBR. Lymphotoxin is produced by lymphocytes and cytotoxic for a wide range of tumor cells in vitro and in vivo.
SUBUNIT: Homotrimer, and heterotrimer of either two LTB and one LTB subunits or (less prevalent) two LTA and one LTB subunits (By

J. Physiol. 273:L524-L530(1997).

-I-FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFRR.

-I-FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFRR.

-I-FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia. Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-I-SUBGINIT: Homotrimex (By similarity).

-I-SUBCELULAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

-I-FTM: The soluble form derives from the membrane form by

-!- FUNCTION: Cytokine that in its homotrimeric form binds to

TNFRSF1A/TNFR1, TNFRSF1B/TNFBR and TNFRSF14/HVEM. In its

heterotrimeric form with LTB binds to TNFRSF14/HVEM. In its

produced by lymphocytes and cytotoxic for a wide range of tumor

cells in vitro and in vivo.

"The Towarton Cyckine that binds to TWRESFLATMEN and
"The TOWARTON: Cyckine that binds to TWRESFLATMEN and
"THERFIP INTER. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
pyrogen causing fever by direct action or by stimulation of
interleukin secretion and is implicated in the induction of
cachexia, Under certain conditions it can stimulate cell
proliferation and induce cell differentiation (By similarity).

CH. SUBGELLULAR MOLOCATION: Type II membrane protein. Also exists as an
extracellular soluble form (By similarity).

CH. PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.
